Section 1 : Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 20 30 40 50
Output: 10 20 30 40 50

Answer

```
// You are using GCC
#include<stdio.h>
#include<stdlib.h>
struct node{
   int id;
   struct node* next;
   struct node* prev;
};

void insertend(struct node** head, int id)
{
   struct node* newnode = (struct node*)malloc(sizeof(struct node));
   newnode->id=id;
   newnode->next=NULL;
   newnode->prev=NULL;
   if(*head==NULL)
   {
      *head=newnode;
      return;
   }
   struct node* temp = *head;
   while(temp->next!=NULL)
   {
      temp=temp->next;
```

```
    }
    temp->next=newnode;
    newnode->prev=temp;
}
void traversefront(struct node* head)
{
    if(head==NULL)
    {
        return;
    }
    struct node* temp = head;
    while(temp!=NULL)
    {
        printf("%d ", temp->id);
        temp=temp->next;
    }
}

int main()
{
    struct node *head = NULL;
    int N; int id;
    scanf("%d ",&N);
    for(int i=0; i<N; i++)
    {
        scanf("%d",&id);
        insertend(&head, id);
    }
    traversefront(head);
    return(0);
}
```

Status : Correct **Marks : 10/10**
